

ACOUSTICS ADVISOR ENDORSEMENT SYDNEY METRO WEST (SSI 10038)

Review of	Central Tunnelling Package: DNVIS for Burwood North	Reviewed document reference:	21028-NV-RP-4-11
Prepared by:	Alternate Acoustics Advisor		Revision 11
Date of issue:	22 November 2023		Dated: 15 August 2023

As approved Alternate Acoustics Advisor (AA) for the Sydney Metro West project, I reviewed and provided comments on previous versions of revision 11 of the Sydney Metro West – CTP – Detailed Noise and Vibration Impact Statement (DNVIS) for Burwood North.

Revision 11 is an update to include that an acoustic lid will no longer be built over the eastern part of the station box excavation. The omission of an acoustic lid over the eastern part of the station box is based on Out of Hours work at this site not exceeding Noise Management Levels (NMLs). While implementation of the shed may no longer be considered feasible and reasonable, my review has focused on other feasible and reasonable mitigation measures that can be applied to manage impacts.

In relation to omission of the acoustic lid over the eastern part of the station box, I note that the DNVIS commits to meeting evening and night-time NMLs at Burwood North for all activities. Noise from lid construction and removal will no longer be experienced.

The above matters have been assessed and endorsed for consistency with the EIS by Sydney Metro's Planning and Environment team. The Acoustic Advisor has no formal role in reviewing or endorsing Sydney Metro's Consistency Assessment (CA), but we have been provided with the CA and note that it addresses noise and vibration impacts.

The DNVIS outlines the consultation completed by AFJV to date and the specific mitigation measures identified so far, through consultation with affected sensitive land users. It also commits to ongoing consultation to continue this process.

Based on the above, I am satisfied that my comments have been adequately addressed and I endorse Revision 11 of AFJV's DNVIS for Burwood North, in accordance with Condition of Approval A36(e).

Definition of acoustic terms and acronyms

Additional mitigation measures – applicable where standard measures have been implemented and NML is still expected to be exceeded. Approved hours Construction hours approved in the Project Conditions of Approval D35. These differ from "standard" hours defined in the ICNG. Work outside the approved hours does not imply the works have not been otherwise approved through the procedures outlined in the NVMP. Assessment period Background The underlying level of noise present in the ambient noise, excluding the noise source under investigation. CoA Sydney Metro West – Concept and Stage 1 Conditions of Approval. Table 1 of the CoA also contains definitions related to the approval. CSSI Critical State Significant Infrastructure Decibel (dB) A measure of sound equivalent to 20 times the logarithm (to base 10) of the ratio of a given sound pressure to a reference pressure, and 10 times the logarithm (to base 10) of the ratio of a given sound power to a reference power. dB(A) Unit used to measure 'A-weighted' sound pressure levels. A-weighting is an adjustment made to sound-level measurement to approximate the response of the human ear. dB(C) Unit used to measure 'C-weighted' sound pressure levels, an adjustment made to sound level to approximate lef frequency noise between 10 Hz and 200 Hz. DPIE NSW Department of Planning, Industry and Environment EIS Environmental Impact Statement Noise resulting from activities that are not typical of the area such as construction, and traffic generated by

Extraneous noise Noise resulting from activities that are not typical of the area such as construction, and traffic generated by
holiday periods or special events such as concerts or sporting events. Normal daily traffic is not considered to be extraneous.
Highly affected receivers are considered to be highly noise affected where construction activities are determined to have an LAeq, 15 minute noise level of 75 dB(A) or higher.
Highly noise Construction activities which are defined as annoying under the ICNG. See Section 2.1.2. intensive works
ICNG Interim Construction Noise Guideline (Department of Environment and Climate Change 2009)
Noise A standard rule or test by which the acceptability of the nature and characteristics of noise may be judged or evaluated. Criteria are generally based on guidelines or standards developed by Government agencies (eg EPA) protect the majority of people for the majority of the time from adverse impacts.
NCA Noise Catchment Area

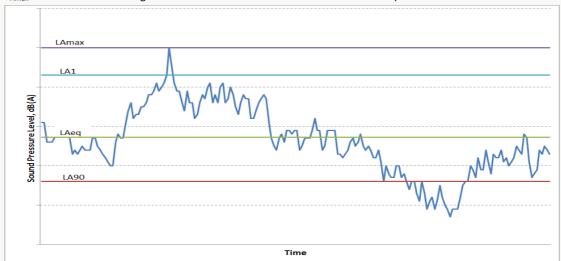

Noise level statistics

 $L_{\rm A90}$ - The A-weighted sound pressure level exceeded 90% of the monitoring period. This is considered to represent the background noise.

 L_{Aeq} - The equivalent continuous A-weighted noise level—the level of noise equivalent to the energy average of noise levels occurring over a measurement period.

 L_{A1} – The A-weighted sound pressure level exceeded 1% of the monitoring period.

 L_{Amax} – The maximum A-weighted noise level associated with the measurement period.

NML	Noise Management Level
NVMP	Noise and Vibration Management Plan
PPV	Peak Particle Velocity – Measurement of ground-borne vibration in units of mm/s
RBL	Rating Background Level - a single figure that represents the background noise level for assessment purposes
ROL	Road Occupancy Licence – granted by Transport for NSW and required for any activity likely to impact on traffic flow.
Sound Power Level (SWL)	The A-weighted sound power level is a logarithmic ratio of the acoustic power output of a source relative to 10-12 watts and expressed in decibels. Sound power level is calculated from measured sound pressure levels and represents the level of total sound power radiated by a sound source.

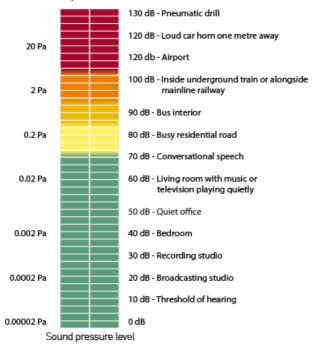

Sound Pressure Level (SPL)

This is the level of noise, usually expressed in dB(A), as measured by a standard sound level meter with a pressure microphone. The sound pressure level in dB(A) gives a close indication of the subjective loudness of noise.

A technical definition for the sound pressure level, in decibels, is 20 times the logarithm (base 10) of the ratio of any two quantities related to a given sound pressure to a reference pressure (typically 20 μ Pa equivalent to 0 dB). Examples of typical sound pressure levels are shown below.

Threshold of pain

Source: https://www.osha.gov/dts/osta/otm/noise/health_effects/soundpropagation.html

Tonal noise	Noise with perceptible and definite pitch or tone
VDV	Vibration dose value – used when assessing intermittent vibration as it is sensitive to peaks in vibration acceleration and accumulates the vibration energy received over the daytime and night-time periods

1. Introduction

1.1 Project overview

Sydney Metro is Australia's biggest public transport program comprising four main packages of work including Metro North West Line, Sydney Metro City and Southwest, Sydney Metro West and Sydney Metro Greater West. The Sydney Metro West component involves the construction and operation of a metro rail line, around 24km in length, between Westmead and the Sydney CBD.

The planning approvals and environmental impact assessment for Sydney Metro West has been split into a number of stages recognising the size of the project. This includes:

- Stage 1 Concept and all major civil construction works including station excavation and tunnelling between Westmead and The Bays. Planning approval for this stage was granted in March 2021.
- Stage 2 All major civil construction works including station excavation and tunnelling from The Bays to Sydney CBD
- Stage 3 Tunnel fit-out, construction of stations, ancillary facilities and station precincts, and operation and maintenance of the Sydney Metro West line

Acciona Ferrovial Joint Venture (AFJV) was commissioned to deliver the Central Tunnel Package of Stage 1, comprising excavation of five sites and around 11.5 kilometres of twin-bore tunnel between The Bays and Sydney Olympic Park (the Project). An overview of the Project is presented in Figure 1-1, which includes the tunnel alignment and location of the station boxes at:

- The Bays
- Five Dock
- Strathfield
- Burwood North
- Sydney Olympic Park

This report covers activities for construction of Burwood North Station box and south shaft located near Burwood's shopping district and directly adjacent to Parramatta Road. The project comprises several phases including:

- Site establishment
- Excavation of the station box
- Tunnelling
- Demobilisation

An overview of the site layout of Burwood North is presented in Figure 1-2.

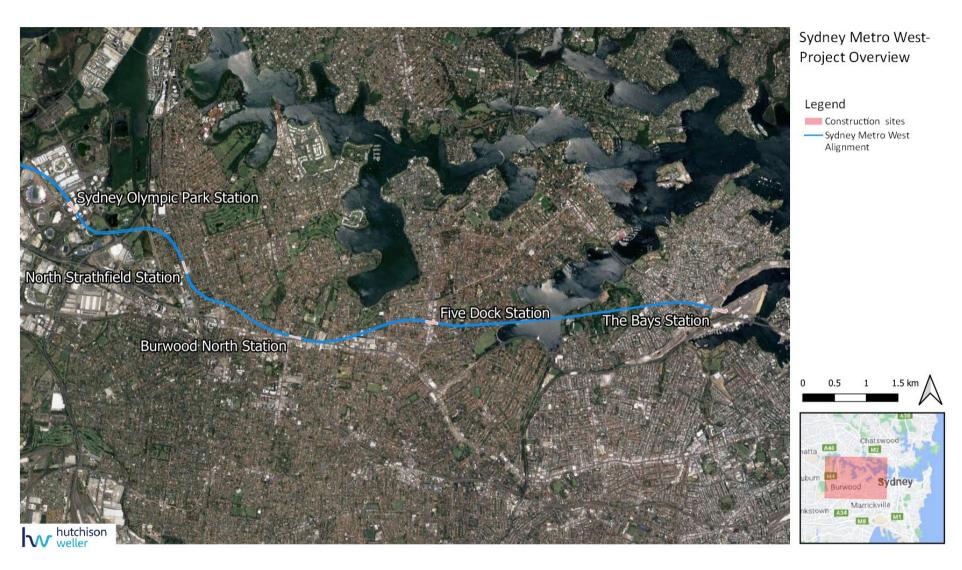

Figure 1-1 Overview of the CTP of Stage 1 of the Sydney Metro West Project.

Figure 1-2 Burwood North construction site

Considering the risk of noise and vibration impact is necessary to ensure appropriate mitigation and management measures can be applied. This Detailed Noise and Vibration Impact Assessment (DNVIS) has been prepared in accordance with the Sydney Metro (2020) Construction Noise and Vibration Standard, v 4.3 (CNVS) and supplements the Project's Construction Noise and Vibration Management Plan (CNVMP) as required in the Project's Condition of Approval (CoA) D43.

The objective of the DNVIS is to establish the location, nature and scale of proposed works, assess the level of impact on the community's amenity and include appropriate mitigation measures identified through consultation with affected sensitive land users.

The structure of this DNVIS addresses the requirements of the Condition of Approval D43 and the CNVS and includes:

- Section 2 Construction works and hours
- Section 3 Identification of noise and vibration sensitive receivers and existing noise levels
- Section 4 Construction noise and vibration objectives
- Section 5 Description of planned works, equipment and sound power levels
- Section 6 Construction noise assessment predicted noise levels and exceedances of objectives, including sleep disturbance
- Section 7 Construction vibration assessment
- Section 8 Traffic noise assessment
- Section 9 Mitigation and management, including consultation

2. Construction works and hours

2.1.1 Planned works

Activities associated with Burwood North are separated into two areas, the Main Site (including Station Box) and the South Site, a support shaft). Construction work outside these sites is covered under the CNVMP and the out of hours work protocol where activities are completed outside approved hours.

Construction phases for each of these sites broadly include site establishment, excavation and then tunnelling support.

The anticipated program is illustrated in Table 2-3 and shows the duration of each phase. Establishment for the site commenced in November 2021 and continue for around 7 months. Excavation commenced in July 2022 and at the South site in January 2023. In total, the project is expected to take around 2 years to complete in Burwood North.

This update to the DNVIS provides additional assessment of changes to the acoustic shed arrangements for the main north site. Work at the southern shaft is being completed during approved hours and there are no changes to this scenario.

At the main station box, site establishment is complete and station box excavation under the acoustic shed has reached operational levels. The eastern section of the station box and tunnel nozzles are yet to be completed. Previous assessment of these activities is not impacted by the proposed changes to site operations which were completed during approved hours.

As per the initial assessment of acoustic sheds for the project, the main site station box is covered with an acoustic shed to the west while the eastern portion of the station box was to be covered with an 'acoustic roof'. Design of the acoustic shed over the western section of the station box was finalised in September 2022. The construction of the western shed is expected to be completed in May 2023.

Installing a roof enclosure over the Burwood North station box would prolong the excavation process. Program delays at Burwood North could have implications for TBM progress which would have flow-on effects for other sites.

Without the roof, spoil can be handled from the surface adjacent to Parramatta Road and provide an alternative spoil handling location outside the acoustic shed. This enables spoil load out to occur during standard construction hours at two points thus alleviating congestion and eliminating the need for continuous out of hours spoil haulage.

An assessment of the changes to the eastern site acoustic roof and associated noise impacts for approved and OOH works based on the current program, has been completed in this update to the DNVIS.

Construction within the cavern at the western end of the station box is currently underway and operational on a 24 hour basis. These works were initially assessed for the Burwood DNVIS where construction was still within the station box and align with the activities described in Phase 4 for mined excavations at the main northern site.

Once tunnelling is underway, all excavation equipment is located within the cavern and ground borne noise and vibration impacts from this aspect of the works is assessed separately in the Tunnelling DNVIS.

For the Burwood site, tunnelling support activities are assessable against the project NML and will occur within the acoustic shed during the cavern excavation prior to the TBM arrival.

Support activities/equipment within the acoustic shed include gantry and kibble for spoil stockpiling, concrete deliveries and spoil haulage via Parramatta Road. At the station box floor around 30 metres from the surface, excavation within the cavern is underway supported by tunnel ventilation and spoil removal in the station box.

After the caverns and station box are excavated cavern lining and some additional excavation would continue until the TBM walk through around February 2024.

During the cavern excavation, noise from the tunnel portal, the scrubber/ventilation fan and spoil haulage and kibble loading would be the only sources from the station box floor. Other surface activities within the acoustic shed would include the gantry crane stockpiling the spoil, spoil haulage trucks removing the spoil and deliveries of concrete and other materials. These activities have been assessed in this DNVIS for OOHW noise impacts with no eastern acoustic roof in place.

In the eastern section of the station box where the acoustic roof has not been constructed, excavation to the station box floor is being completed in preparation for mining of the eastern tunnel nozzles as described in Phase 3 activities at the main northern site. Without the acoustic roof, these works will be limited to daytime operations only.

Table 2-1 and Table 2-2 present a summary the activities for each of the Burwood construction sites.

Table 2-1 Summary of proposed activities at the Main site

Construction phase	Activity		Outside approved hours?					
	1a	General activities	No

2.1.2 Approved construction hours

Working hours are set by CoA D35 to D36 as summarised in Table 2-4. Use of power saws, rock breakers, drills and other tonal or impulsive activities are defined as annoying under the Interim Construction Noise Guideline (ICNG) and are 'highly noise intensive works'.

Table 2-4 Approved construction hours

CoA	Construction activity	Monday to Friday	Saturday	Sunday / Public holiday
D35	Approved construction	7:00 am to 6:00 pm	8:00 am to 6:00 pm	No work (unless approved under out-of-hours work protocol)
D36	Highly noise intensive works	8:00 am to 6:00 pm ¹	8:00 am to 1:00 pm ¹	No work (unless approved under out-of-hours work protocol)

Notes:

1. if continuously, then not exceeding three hours, with a minimum cessation of work of not less than one hour.

2.1.3 Variations to work hours

In some circumstances, the planned construction activities would be undertaken outside the hours described in CoA D35 and D36. As specified in the Conditions of Approval, these activities include those which are:

- Low impact as described in CoA D37b), including:
 - i. construction that causes LAeq(15 minute) noise levels:
 - no more than 5 dB(A) above the rating background level at any residence in accordance with the ICNG, and
 - no more than the 'Noise affected' NMLs specified in Table 3 of the ICNG at other sensitive land user(s); and
 - ii. construction that causes LAFmax(15 minute) noise levels no more than 15 dB(A) above the rating background level at any residence; or
 - iii. construction that causes:
 - continuous or impulsive vibration values, measured at the most affected residence are no more than the preferred values for human exposure to vibration, specified in Table 2.2 of Assessing Vibration: a technical guideline (DEC, 2006), or
 - intermittent vibration values measured at the most affected residence are no more than the preferred values for human exposure to vibration, specified in Table 2.4 of Assessing Vibration: a technical guideline (DEC, 2006).
- By Prescribed Activity, as described in CoA D37d) and applying to Burwood North construction scenarios:
 - tunnelling (excluding cut and cover tunnelling and surface works) which is permitted 24 hours a day, seven days a week; or
 - iii. delivery of material that is required to be delivered outside of standard construction hours in Condition D35 of this schedule to directly support tunnelling activities, except between the hours 10:00 pm and 7:00 am to / from the Five Dock and Westmead construction sites and to / from Burwood North construction site using any roads / streets other than directly from Parramatta Road; or
 - iv. haulage of spoil except between the hours of 10:00 pm and 7:00 am to / from the Five Dock and Westmead construction sites and to / from Burwood North construction site using any roads / streets other than directly from Parramatta Road;

v. work within an acoustic shed where there is no exceedance of noise levels under Low impact circumstances identified in (37b), unless otherwise agreed by the Planning Secretary.

Note: Tunnelling does not include station box excavation

Where out-of-hours work is necessary, appropriate respite would be identified in consultation with the affected community, in line with the NVMP. As per CoA D51, consultation would include providing:

- a progressive schedule for periods no less than three (3) months, of likely out-of-hours work;
- a description of the potential work, location and duration of the out-of-hours work;
- the noise characteristics and likely noise levels of the work; and
- likely mitigation and management measures which aim to achieve the relevant NMLs (See Section 4) including circumstances of when respite or relocation offers would be available and details about how the affected community can access these offers.

3. Existing environment

3.1 Existing environment

The Burwood North construction zone covers two separate locations, namely Burwood North – Main (Main site), which includes the station box, and Burwood North – South (South site), as illustrated in Figure 1-2.

The Main site is located north of Parramatta Road, near the intersection of Parramatta Road and Burwood Road and covers an area of around 1.3 hectares. Adjacent land uses to this site, fronting Parramatta Road, are mostly commercial businesses with some mixed-use commercial/residential buildings.

North of the Main site, residential receivers are on Burton Street, with the nearest backing directly onto the project boundary. To the north of the site is also St Luke's Church, which is heritage listed.

The South site is located to the south of Parramatta Road, also bounded by Burwood Road and Esher Street and Esher Lane with a footprint of around $1480 \, \text{m}^2$. This site has commercial premises located to the east and mixed commercial and residential $10 \, \text{storey}$ residences to the south. The heritage listed Bath Arms Hotel is located $20 \, \text{metres}$ west of the South site.

The acoustic environment in all areas is described in the EIS as dominated by road traffic noise on the major transport corridors such as Parramatta Road and Burwood Road.

To assess and manage construction noise and vibration impacts, a detailed land use survey was prepared for the Project in line with CoA D34, with results of the survey provided in the Construction Noise and Vibration Management Plan (CNVMP) and relevant land uses to Burwood North are presented in Appendix A of this DNVIS.

3.2 Heritage items

There are several items of heritage value identified in the EIS, which include the following. These items will be considered for impacts of vibration-intensive activities.

- St Luke's Anglican Church
- Bath Arms Hotel
- Semi-detached houses along Burwood Rd

3.3 Noise catchment areas

To facilitate the assessment of noise impacts from the project and to apply representative Noise Management Levels (NMLs) to all receivers, receivers adjacent to the Burwood sites have been divided into Noise Catchment Areas (NCAs).

NCAs group individual sensitive receivers by representative traits such as existing noise environment and potential exposure to noise and vibration from the Project.

NCAs were established as part of the EIS, are summarised in Table 3-1 and illustrated in Figure 1-1. Background noise monitoring has been completed as part of the EIS to apply appropriate NML to each NCA (see Section 4.2).

NCA	Location	Description	Ambient noise influences
NCA12	Burwood, North of	Mainly residential, with some	Existing noise is controlled by road
	Parramatta Road	commercial areas along Parramatta	traffic. The area surrounding the
		Road. 'Other sensitive' receivers include	construction site is mostly residential
		Concord High School, St Mary's Catholic	and the nearest receivers are near the
		Primary School, St Marys Catholic Church	northern boundary of the northern
		and St Luke's Anglican Church	construction site and the southern
NCA13	Burwood, South of	Mainly residential, with commercial	boundary of the southern Construction
	Parramatta Road	areas along Parramatta Road and	Site. Commercial receivers are also
		Burwood Road. 'Other sensitive'	adjacent to the site, along Parramatta
		receivers include Sydney Central ENT,	Road, and are of general retail use
		Bath Arms Hotel, Southern Cross	
		Catholic College and Methodist Ladies	
		College.	

3.4 Background noise survey

Background noise monitoring was undertaken as part of the wider Sydney Metro West Project EIS (Section 2, Technical Paper 2) through unattended background noise monitoring at representative locations. Monitoring was completed in March and July 2019 for each of the NCAs listed in Table 3-1.

The Burwood area is heavily influenced by traffic flows that generate lower noise levels during the night-time than the daytime and evening periods. This pattern of reduced noise levels in the evening and night time is characteristic of urban and suburban areas, where there is no industrial or infrastructure noise influences.

The baseline information was used to establish the Rating Background Level (RBL), which represents the average minimum background sound level for each measurement period, averaged over the measurement days. The RBL at each NCA is provided in Table 3-2.

Table 3-2 Background noise levels

	Noise level (dBA) ¹									
NCA	Day ²	Evening ²	Night ²							
NCA12	43	43 (47) ³	42							
NCA13	48	48	44							

Notes:

- 1. The RBL values have been extracted from the EIS; refer to Table 4 in the EIS Technical Paper 2.
- 2. Daytime is 7:00am to 6:00pm, evening is 6:00pm to 10:00pm and night-time is 10:00pm to 7:00am.
- 3. During the EIS noise assessment, the monitoring level was found to be higher than the daytime. In this situation, the NPfl requires that the evening level be reduced to match the daytime

4. Noise and vibration assessment criteria

4.1 Overview

Project CoA D43 requires planned works to be assessed within this DNVIS where any planned works may exceed the NMLs, vibration criteria and/or ground-borne noise levels specified in CoA D39 and D40 at any residence outside construction hours identified in CoA D35, or where receivers will be highly noise affected.

This DNVIS includes specific mitigation measures identified through consultation with affected sensitive land user(s) and these mitigation measures will be implemented for the duration of the early works investigations.

This DNVIS has been provided to the AA and ER before the commencement of the planned works.

CoA D39 requires noise and vibration from construction activity to be managed with guidance from:

- Noise: the Interim Construction Noise Guideline (ICNG, DECC 2009)
- Vibration for human exposure: Assessing Vibration: A Technical Guideline (DEC, 2006)
- Vibration for building damage: BS 7385 Part 2-1993 Evaluation and measurement for vibration in buildings Part 2, and
- Vibration for damage of unsound heritage items: DIN 4150-3 Structural Vibration effects of vibration on structures.

The over-arching document for assessment and management of noise and vibration impacts on this Sydney Metro project is the Sydney Metro *Construction Noise and Vibration Standard* (CNVS, vers. 4.3, Transport for NSW 2020). The following sections outline the framework of these guidelines and the way this DNVIS will assist to assess and manage impacts.

4.2 Noise

4.2.1 ICNG

The CNVS refers to the *Interim Construction Noise Guideline* (ICNG) (DECC 2009), which provides guidance on management of construction noise. The ICNG notes noise that exceeds background noise levels may result in adverse impacts and an increased likelihood of complaints.

During approved hours, where construction noise is within 10 dB(A) of the RBL, impacts are considered acceptable. Where construction noise is more than 10 dB(A) above the RBL, a residential receiver is taken to be noise affected and the proponent should undertake all reasonable and feasible steps to manage the impact and consult with the affected community.

Above a $L_{Aeq, 15 \text{ minute}}$ noise level of 75 dB(A), a residential receiver is considered to be highly noise affected, requiring respite to be given in consultation with the regulatory authority and the community.

Outside approved construction hours, construction noise at a residential receiver more than 5 dB(A) above the RBL is taken to be noise affected.

In addition, noise from activities/equipment such as rock hammers, impact piling, or other impulsive noise sources usually result in greater annoyance than continuous construction noise. A 5 dB(A) penalty is applicable to such activities prior to comparison with the NMLs and a 3 hours on, 1 hour off respite schedule applies.

A noise level above $L_{Aeq \, 15min}$ 70 dB(A) at a commercial property is considered to warrant noise mitigation. Similarly, an industrial facility would warrant noise mitigation at $L_{Aeq \, 15 \, minute}$ noise levels above 75 dB(A).

Table 4-1 presents management levels for noise at other relevant sensitive land uses based on the principle that the characteristic activities for each of these land uses should not be unduly disturbed.

Internal noise levels are assessed at the centre of the occupied room. Where internal noise levels cannot be measured, external noise levels may be used. A conservative estimate of the difference between internal and external noise levels is 10 dB for buildings other than residences.

Table 4-1 NMLs for non-residential sensitive receivers

Sensitive receiver type	NML applicable when in use,
	LAeq, 15 min
Classrooms at schools and other educational institutions	Internal noise level 45 dB(A)
Childcare centres	
- sleeping areas	Internal noise level 45 dB(A)
- play areas	External noise level 65 dB(A)
Hospital wards and operating theatres	Internal noise level 45 dB(A)
Places of worship	Internal noise level 45 dB(A)
Active recreation areas (characterised by sporting activities and	External noise level 65 dB(A)
activities which generate their own noise or focus for participants,	
making them less sensitive to external noise intrusion)	
Passive recreation areas (characterised by contemplative activities that	External noise level 60 dB(A)
generate little noise and where benefits are compromised by external	
noise intrusion, for example, reading, meditation)	
Community centres	Refer to the recommended 'maximum' internal
	levels in AS2107 for specific uses.

4.2.2 Sleep disturbance

The CNVS requires maximum noise levels to be analysed in terms of the extent and number of times the maximum noise exceeds specific noise trigger levels, in general accordance with the Noise Policy for Industry (Npfl) (EPA 2017). These triggers are:

- LAeq, 15 minute 40 dBA or the prevailing RBL plus 5 dB, whichever is greater, and the
- Lamax 52 dBA or the prevailing RBL plus 15 dB, whichever is greater.

The Npfl also recommends the DECCW (2011) Road Noise Policy (RNP) be reviewed for further risk assessment. The RNP recommends maximum internal noise levels below 50–55 dB(A) are unlikely to awaken people from sleep and one or two noise events per night, with maximum internal noise levels of 65–70 dB(A), are not likely to affect health and wellbeing significantly.

4.2.3 Ground-borne noise

CoA D40 requires all reasonable and feasible mitigation measures to be applied when the following residential ground-borne noise levels are exceeded. These levels are only applicable when ground-borne noise levels are higher than airborne noise levels at residential receivers during the evening and night periods.

- a) evening (6:00 pm to 10:00 pm) internal LAeq(15 minute): 40 dB(A); and
- b) night (10:00 pm to 7:00 am) internal LAeq(15 minute): 35 dB(A).

4.2.4 Construction traffic

While operating within the construction site, construction vehicles are assessed as part of the construction activity of which they are a part. However, once these vehicles leave the construction site and enter public roads, they are assessed as road traffic.

The Road Noise Policy (RNP) is generally adopted to assess the impact of construction traffic on public roads. A screening test is first applied to establish whether existing road traffic noise levels will increase by more than 2 dB due to construction traffic. Where any noise increase is less than 2 dB, the objectives of the Road Noise Policy have been met.

The CNVS recommends, where the road traffic noise levels are predicted to increase by more than 2 dB as a result of construction traffic, consideration should be given to feasible and reasonable noise mitigation measures to reduce the potential noise impacts and preserve acoustic amenity.

Actual noise levels associated with construction traffic will be monitored and compared to the following road traffic noise criteria in the RNP.

- 60 dB LAeq(15hour) day and 55 dB LAeq(9hour) night for existing freeway/ arterial/ sub-arterial roads.
- 55 dB LAeq(1hour) day and 50 dB LAeq(1hour) night for existing local roads.

Where exceedances of the RNP are attributed to construction traffic, consideration for mitigation would be made in accordance with the project CoA and the Revised Environmental Mitigation Measures (REMM).

4.2.5 Additional mitigation measures

The CNVS builds on the guidance provided by the ICNG and recommended further mitigation measures where all reasonable and feasible mitigation measures to minimise noise at the nearest receivers have been implemented and construction noise is still predicted to exceed the noise or vibration objectives. The Additional Mitigation Measures Matrix (AMMM) for airborne and ground-borne noise taken from the CNVS are presented in Table 4-2 and Table 4-3.

Table 4-2 Additional Mitigation Measures Matrix for airborne noise (CNVS)

Construction hours	dB above NML	Additional management measures					
Approved hours	0 to 10	-					
Monday – Friday: 7am – 6pm	10 to 20	LB					
Saturday: 8am to 6pm	20 to 30	LB, M, SN					
	>30	LB, M, SN					
Evening	0 to 10	LB					
Monday – Friday: 6pm – 10pm	10 to 20	LB, M					
Saturday: 7am – 8am, 6pm – 10pm	20 to 30	LB, M, SN, RO					
Sunday / PH: 8am – 6pm	> 30	LB, M, SN, IB, PC, RO					
Night	0 to 10	LB					
Monday – Saturday: 10am – 7am	10 to 20	LB, M, SN, RO					
Saturday: 10pm –8am)	20 to 30	LB, M, SN, IB, PC, RO, AA					
Sunday / PH: 6pm –7am	> 30	LB, M, SN, IB, PC, RO, AA					

Notes: PC = Phone call/Email

SN = Specific notification

M = monitoring
IB = Individual briefings

LB = Letterbox drops
DR = Duration reduction

AA = Alternative accommodation

RO = Project specific respite offer

Table 4-3 Additional Mitigation Measures Matrix for ground-borne noise (CNVS)

Construction hours	dB above NML	Additional management measures						
Approved hours Monday – Friday: 7am – 6pm Saturday: 8am to 6pm	No NML for ground-borne noise during standard hours (refer to Table 4-7)							
Evening	0 to 10	LB						
Monday – Friday: 6pm – 10pm	10 to 20	LB, M, SN						
Saturday: 7am – 8am, 6pm – 10pm Sunday / PH: 8am – 6pm	> 20	LB, M, SN, IB, PC, RO						
Night	0 to 10	LB, M, SN						
Monday – Saturday: 10am – 7am	10 to 20	LB, M, SN, IB, PC, RO, AA						
Saturday: 10pm –8am) Sunday / PH: 6pm –7am	> 20	LB, M, SN, IB, PC, RO, AA						

Notes: PC = Phone call/Email SN = Specific notification

 $\begin{aligned} & M = monitoring & LB = Letterbox \ drops \\ & IB = Individual \ briefings & DR = Duration \ reduction \end{aligned}$

AA = Alternative accommodation RO = Project specific respite offer

4.3 Project-specific construction noise management levels

Based on the measured RBLs for each NCA and requirements of the ICNG and CNVS, project-specific NMLs are summarised in Table 4-4. NMLs for non-residential receivers are described in Table 4-1.

Table 4-4 Noise management levels

NCA			Noise N	lanagement Level	LAeq 15 minute							
	Appro	ved hours	Outside approved hours									
	Noise Highly noise affected		Day	Evening	Night	Sleep disturbance (CNVS)						
	arrected	anected				L _{Aeq} , 15 minute	L _{Amax}					
NCA12	53	75	48	48	47	47	57					
NCA13	58	75	53	53	49	49	59					

4.4 Vibration management

4.4.1 Human comfort

When assessing human exposure to construction-related vibration, the CNVS requires vibration goals to be established using *Environmental Noise Management Assessing Vibration: A Technical Guideline* (DECC 2006), which provides criteria for the assessment of vibration impacts on humans.

Construction activities typically generate vibration of an intermittent nature, which is assessed using a Vibration Dose Value (VDV). Acceptable values of vibration doses are presented in Table 4-5 for sensitive receivers.

Table 4-5 VDV Vibration criteria

Receiver type	Low probability of adverse comment (m/s ^{1.75})	Adverse comment possible (m/s ^{1.75})	Adverse comment probable (m/s ^{1.75})
Residential buildings – 16 hour day $(7am to 11pm)^1$	0.2 to 0.4	0.4 to 0.8	0.8 to 1.6
Residential buildings – 8 hour night $(11pm to 7am)^1$	0.13	0.26	0.51

Note 1: Day time and night time as described in BS6472:1992 (as referenced in the CNVS), i.e. a daytime period of 16 h or a night time period of 8 h, for example 23.00 h to 07.00 h.

4.4.2 Buildings

Potential building damage from construction vibration requires the application of values in BS 7385 Part 2-1993 *Evaluation and measurement for vibration in buildings* Part 2. These values are presented in Table 4-6 and relate to transient vibration which does not give rise to resonant responses in structures, and to low-rise buildings.

Table 4-6 Guideline values for vibration velocity for the effects of short-term vibration on structures (BS 7385).

Line	Type of building	Peak component particle velocity in frequency range of predominant pulse						
		4 Hz to 15 Hz	15 Hz and above					
1	Reinforced or framed structures Industrial and heavy commercial buildings		50					
2	Unreinforced or light framed structures Residential or light commercial type buildings	15 at 4 Hz increasing to 20 mm/s at 15 Hz	20 mm/s at 15 Hz to 50 mm/s at 40 Hz and above					

Where vibration may give rise to magnification due to resonance, especially at lower frequencies where lower guide values apply, the guide values may be reduced by 50%. The CNVS describes rock breaking/hammering and sheet piling activities as having potential to cause dynamic loading in some structures (e.g. residences).

For activity involving rock breakers, piling rigs, vibratory rollers, excavators, vibration predominantly occurs at frequencies in the 10 Hz to 100 Hz range. On this basis, a conservative vibration damage screening level is:

Reinforced or framed structures: 25.0 mm/s

Unreinforced or light framed structures: 7.5 mm/s

4.4.3 Heritage

Heritage buildings and structures would be assessed under a conservative cosmetic damage objectives of 2.5 mm/s peak component particle velocity (from DIN 4150). Where vibration levels at heritage items are identified as exceeding this screening level, structural assessment would be completed by the Project team to confirm the structure's sensitivity to vibration. If a heritage building or structure is found to be structurally unsound

(following inspection) the conservative criterion would stand. Where the structure is suitably sound, the guideline values from Table 4-6 would be applicable.

4.4.4 Additional mitigation measures

The CNVS recommends additional mitigation measures where all standard mitigation measures to minimise vibration at the nearest receivers have been implemented and vibration is still predicted to exceed the maximum guideline values. The Additional Mitigation Measures Matrix (AMMM) for vibration from the CNVS is presented in Table 4-7. Acronyms are defined at Table 4-2.

Table 4-7 Additional Vibration Mitigation Measures (CNVS)

Construction hours	Mitigation measures where
	predicted vibration levels exceed maximum levels

5. Impact assessment

5.1 Plant and equipment

A summary of proposed activities at the Burwood sites was provided in Table 2-1. Nominal equipment and estimated sound power levels of each item and activity are presented in Appendix B. All activities are proposed during approved hours only until the acoustic shed is completed.

During site establishment, it is likely several activities would be undertaken concurrently so cumulative impacts have been assessed as part of this DNVIS. Similarly, concurrent excavation of the main station box and southern shaft has been considered (see Section 6).

Sound power levels (SWLs) and predicted noise levels depend on the number of plant items operating at any one time and their precise location relative to a sensitive receiver. The SWLs include item quantities and nominal usage factors (proportion of a 15-minute assessment period the equipment would be operating at its maximum noise output).

5.2 Noise modelling

SoundPlan noise modelling software was used to calculate noise impacts in accordance with the ISO9613 prediction method at all identified noise-sensitive receivers. The model included:

- Topography 1 metre DEM based on LPI Lidar data.
- Individual buildings for façade calculations and to account for shielding and reflections. Building heights are also taken from Lidar data.
- Individual sensitive receivers One receiver location representing each residential dwelling and located 1.5
 metres above most affected floor level (e.g. level 2) and most-affected façade at up to around 600 metres
 radius.
- Construction noise sources —Activities and equipment included in the noise model as area sources in locations specified by AFJV. SoundPlan takes the worst-case point within each area to perform its calculations, a conservative approach. Sound power levels in Appendix B. Source is modelled at 1.5 metres above ground.
- Meteorology –worst-case conditions: gentle breeze (3-5 m/s) source to receiver and stable conditions (conducive of temperature inversion).

5.3 Mitigation measures included in the modelling

Mitigation measures are to be implemented to ameliorate noise impacts as standard practice throughout the duration of the works. Mitigation measures, which may affect the predicted levels include the following, which have been incorporated in the assessment as base assumptions for noise predictions.

- Source noise control strategies:
 - Where the NML outside approved hours cannot be achieved, work is not proposed to be undertaken unless unavoidable and completed under the procedures contained in the CNVMP.
 - Equipment sound power levels will not exceed those described in Table 13 of the CNVS.
 - Residential grade mufflers fitted to all mobile plant, with equipment maintained and operated effectively.
 - 'Damped' rock hammers with reductions of around 10 dB in comparison to similar sized un-damped hammers
 - No shouting or swearing or playing of loud radios

- Engine and exhaust brakes avoided
- Site layout planned to allow noisy stationary plant to be placed behind larger objects or as far from receivers as possible
- Engines switched off when not in use for extended periods (15 minutes) and no idling trucks in front of residences
- Dropping of heavy objects or metal-on-metal impacts avoided
- Non-tonal reverse alarms installed on all mobile equipment regularly used on the project and all equipment outside approved hours.

The above measures were included in the assessment and are reiterated in Section 7.

Noise control strategies:

- Various forms of hoarding are proposed, with a mix of 2.4m high Class A hoarding direct to slab, 2.4m high Class A hoarding on concrete barriers and retention of existing building facades at the site boundary. These are summarised in Figure 5-1 and were included in modelling for all site establishment activities
- Rock hammers were used where required when breaking up building slabs, with alternative methods used in "no hammer" zones within the SWD detailed in Section 6.3. where use of hammers was unavoidable, noise mats or suitable noise screens around the activity were implemented where practicable.
- During the piling and capping beam phase, work on the site structures including the acoustic shed began. The final layout for the station box will be a combination of acoustic shed over the western end of the station box and hoarding around the eastern excavation area.

To provide safe access around the boundary, an interim hoarding configuration will be used after the demolition phase, during the construction of the acoustic shed. Following shed construction, the final hoarding design will be implemented. The planned hoarding arrangement pre and post shed construction is presented in Figure 5-1 and Figure 5-2.

Acoustic shed:

- The 20 metre tall acoustic shed over the main shaft excavation has been modelled with a weighted noise reduction, Rw of 35 with transmission loss equivalent or better than values in Table 5-1. Modelling assumes roller doors are closed during OOHW periods. Closing of shed doors will be managed through on-site practices, inspections and monitoring.

Table 5-1: Acoustic shed transmission loss at frequencies (Hz)

	63	125	250	500	1000	2000	4000
3	19.7	18.8	24.7	31.1	39.5	45.8	52.5

Intake and exhaust noise from the Acoustic shed has been accounted for in the model based on the preliminary shed design with the vent openings in the roof. Intake and exhaust fans have silenced, ducted inlets and exhausts on the roof.

Figure 5-3 presents an artist impression of the location and scale of the main acoustic shed

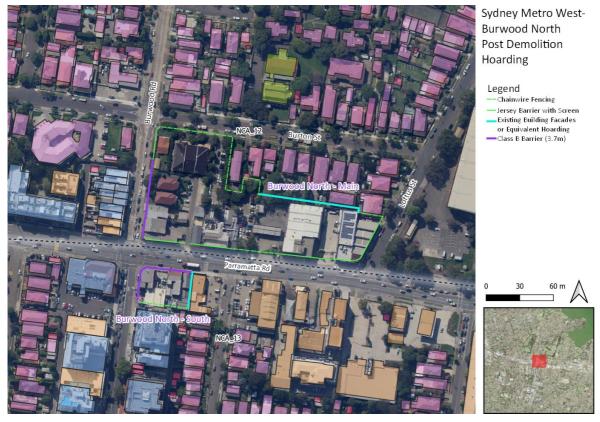

Figure 5-1 Hoarding layout - Post demolition, pre acoustic shed

Figure 5-2 Hoarding layout – Final layout

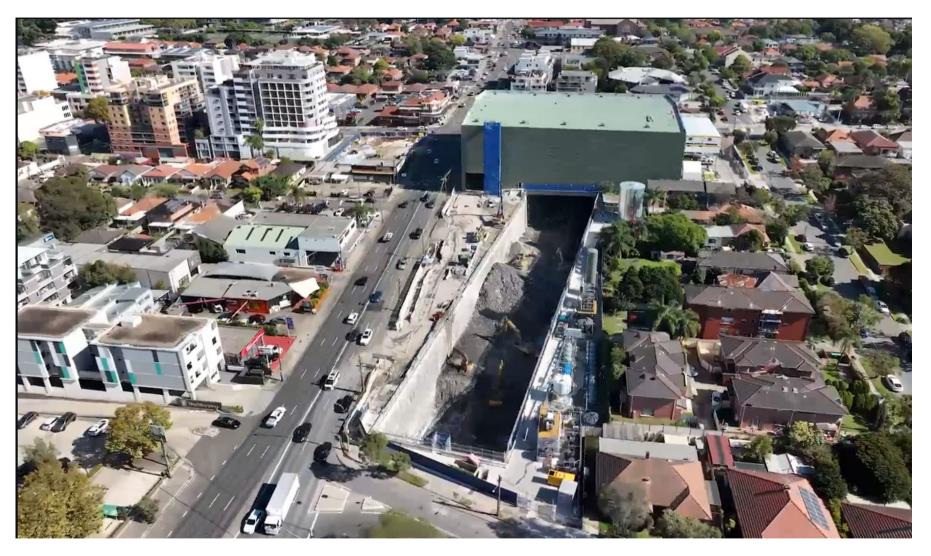

Figure 5-3 Burwood Acoustic shed and open station box excavation (looking west along Parramatta Road)

6. Predicted noise levels

6.1.1 Overview

A summary of predicted noise levels for works during approved hours is provided in the following sections for each construction phase. For site establishment and initial shaft construction, there would be no OOHW undertaken. Detailed results for all sensitive receivers are provided in Appendix D.

Noise contours for selected activities are presented in Appendix C showing the extent of the impacts with the greatest impacts predicted at receivers immediately adjacent to the works. Contours illustrate that existing buildings around the work sites generally provide good noise screening to houses situated further back from the construction sites.

6.1.2 Site establishment works (Phases 1 & 5)

A summary of predicted noise levels at residential and non-residential land uses and predicted exceedances of the NMLs are presented in Table 6-1.

Site establishment have been completed during approved hours. At that time, exceedances of the NML were likely, with most being minor (1-10 dB). However, 4-6 receivers may have experienced highly intrusive noise levels during activities like concrete pours, utilities relocations and general construction works.

Where hammering was required at the main site to excavate existing building foundations the noise impacts were predicted to be high with up to 17 residential receivers likely to be highly noise affected (>75 dBA) when works are in close proximity. Any highly noise intensive work was undertaken in accordance with COA D36 and are reflected in Table 7-1 detailing standard mitigation measures relating to construction hours.

At the South site, exceedances of impact classes were lower given the higher NML and the greater number of commercial receivers in the area. During demolition at the south site, the highest impact was predicted for demolition where 163 receivers may have experienced exceedances of the daytime NML of up to 10 dB, with 38 receivers experiencing impacts in the 10-20 dB range and up to 10 receivers in the greater than 20 dB range.

6.1.3 Construction within shed (Phases 2 - 4 & 6 - 8)

At the Main and South sites work of the initial shaft construction included piling and break-back (by cropping where possible), pouring of capping beams and installation of active ground anchors, and construction of the acoustic shed.

The western end of the station box is covered with an acoustic shed while the eastern section is an open excavation. Construction of the acoustic shed west began after piling and capping beams within the footprint of the shed were completed. Erection of the shed followed the footing foundations, spoil structure, and slab pours.

The acoustic shed construction is now complete and this update to the DNVIS covers activities inside the station box area below the shed during tunnelling for all assessment periods for the main site. Work within the station box has progressed out of sequence for some of the assessed activities and with the eastern end of the station box uncovered, some activities are restricted to daytime only operations.

Work within the western end of the station box has progressed to the cavern excavation stage where all activities are associated with tunnelling operations. Excavation using road headers, drill rigs and shotcrete rig is wholly within the cavern, while tunnelling support for spoil removal and ventilation facilities are operational within the station box.

Currently spoil stockpiling from tunnelling is confined to the middle section of the station box during the day. This location is also used for stockpiling to facilitate the remaining excavation around the tunnel nozzles at the eastern portal.

During OOH periods, stockpiling will be confined to the western end of the station box below the acoustic shed and all stockpiling and spoil handling activities will be handled within the acoustic shed by the end of April 2023.

Activities within the acoustic shed and the station box directly below will be limited to spoil removal and tunnelling support during OOH periods. Noisy activities such as hammering and nozzle construction in the station box east would be undertaken during approved hours only. Other construction activities within the station box and adit may be undertaken during OOH periods where the works are NML compliant at the nearest residences.

There are no predicted exceedances of the NML for the tunnelling within the mined cavern and tunnelling support inside the acoustic shed during the OOH periods.

As there are no excavation activities within the station box area during the evening and night, and noisy activities are scheduled for approved hours only, the deletion of the acoustic roof over the eastern section of the station box is not expected to impact nearby residential receiver locations during the cavern excavation. During standard construction hours, noise levels will be higher during shaft excavations in the absence of an acoustic roof, however, the noise levels will decrease as the excavation deepens.

A noise monitoring survey of the tunnelling and support activities would be completed to confirm compliance with the predicted noise levels for the revised OOHW scenario for tunnelling and support. Without the eastern acoustic roof, general excavation within the station box including the nozzle excavation work at the eastern portal would have an increased noise impact at the nearest residences. Predicted exceedances of up to 10 dB above the daytime NML for 21 receiver locations and 3 receivers would experience noise impacts in the 10-20 dB range.

The predicted noise impacts for the cavern and nozzle excavations are presented in Table 6-2 and the modelled noise contours are shown in Appendix C.

6.1.4 Cumulative impacts

Works in the Main and South sites may occur concurrently. Considering the placement of sensitive receivers relative to each site, cumulative impacts would be minimal, with the nearest site to each residence being the dominant influence on construction noise levels.

When multiple activities are underway on the Main or South sites, predicted levels at any receiver would be influenced primarily by the closest activity. As a worst case, if two similarly noisy activities were underway equidistant from a single receiver, the noise level would increase by 3 dB.

6.1.5 Sleep disturbance

For activities outside approved hours any work within the main station box would be compliant with CoA D37 or the project the EPL. Activities external to the site undertaken outside of approved hours is covered separately under the project OOHW protocol.

Activities to be completed outside standard hours would be wholly within the cavern or within the footprint of the acoustic shed. These works have been assessed to be NML compliant, therefore would not exceed the sleep disturbance criteria.

At the southern shaft site, there are no planned excavation works outside approved hours and therefore sleep disturbance impacts are not applicable.

Other out of hours work not associated with site activities may be undertaken where they comply with CoA D37 and EPL 21610 and these works would be assessed through the out of hours works process.

6.2 Ground-borne noise

Ground-borne noise impacts are associated with tunnelling or other subterranean works, which have the potential to generate vibration in the ground which translates into noise as it radiates to internal living spaces. These impacts are considered where noise within a building envelope caused by ground transmission is greater than airborne noise from the construction project.

During site establishment, no substantial vibration-intensive activities are proposed that would create indoor noise levels greater than airborne noise from construction activity. Further, no works are proposed below ground. Therefore, ground-borne noise does not require further assessment or consideration of mitigation measures.

The requirement to consider ground-borne noise is applicable to tunnelling or other subterranean works which have the potential to generate airborne noise impacts at the same receiver. During excavation of the tunnel support shafts, vibration-intensive equipment such as rock hammers and rock bolters would be used. Road headers would also be employed to excavate the mined cavern at the western end of the station box.

A range of ground-borne noise monitoring has been completed over the last few years in Sydney, which provides an indication of the level of ground-borne noise to be experienced by sensitive receivers for work at various 3-dimensional slant distances from the vibration sources. A sample of measured ground-borne noise data for road headers, rock breaking and rock bolting is provided in Figure 6-1 to Figure 6-3.

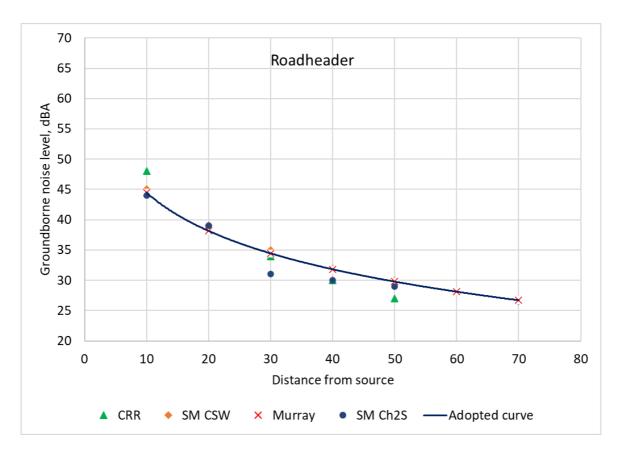

Figure 6-1 Ground-borne noise for road header at various slant distances¹

¹ CRR (2011) Cross River Rail EIS Construction noise and vibration, SM CSW (2019) Sydney Metro City and Southwest EIS construction noise and vibration, Murray (2003) Tunnelling noise and vibration management, Technical Review, SM Ch2S (2016) Sydney Metro Chatswood to Sydenham Technical Paper.

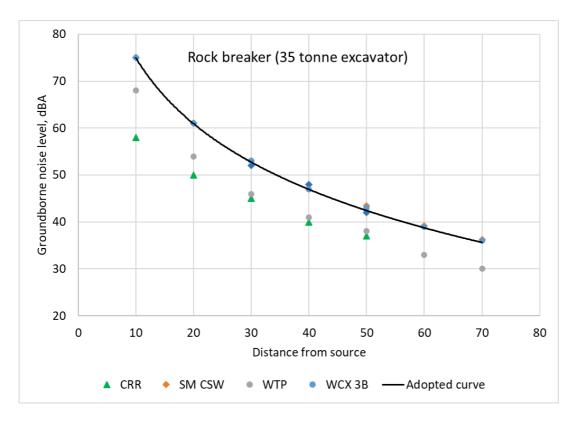

Figure 6-2 Ground-borne noise for 32 tonne excavator with rock breaker at various slant distances²

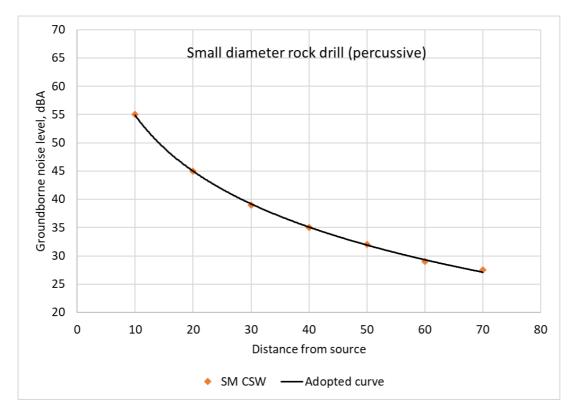

Figure 6-3 Ground-borne noise for road bolter at various slant distances

² WTP(2020) Sydney Metro West Stage 1 EIS Technical Paper on Noise and Vibration, WCX 3B (2020) M4-M5 Link Rozelle Interchange Construction Noise and Vibration Impact Statement

Ground-borne noise criteria are not applicable while airborne noise remains the dominant influence on amenity at a sensitive receiver. With the removal of the eastern acoustic roof, night works within the station box that generate ground borne noise are no longer applicable to this DNVIS. Where vibration generating activities occur outside approved hours within the western cavern, the GBN impacts are assessed separately in the tunnelling DNVIS.

6.3 Vibration impact assessment

6.3.1 Assessment method and reference data

There are two stages of works where vibration-intensive works are required. The first during site establishment, which would be limited to some compaction by vibratory rollers and some hammering if necessary during demolition of existing buildings. The second, is where non-rippable excavation occurs within the station box area.

Potential items of plant that can generate vibration impacts are:

- Rock hammers
- Vibratory rollers

To assess the likelihood of impacts on human comfort and structures, reference vibration levels are summarised in Table 6-3 and curves of vibration with distance are presented in Figure 6-1. Reference vibration levels are based on previously measured levels.

Table 6-3 Summary of vibration-intensive activities

Activity	Typical equipment	Typical PPV vibration emission levels	Source
Demolition/Rock	20 t Excavator with hammer	2.9 mm/s at 10 m	Site measurement
hammer	47 t Excavator with hammer	4.8 mm/s at 10 m	Site measurement
Site compaction	Vibratory roller 11 tonne	3.6 mm/s at 10 m	Site measurement

Based on the estimated vibration emission levels of each activity and the following equation for geometric damping (conservatively ignoring material damping), predicted levels of vibration with distance can be established.

$$PPV_2 = PPV_1 \left(\frac{R_1}{R_2}\right)^n$$

Where:

PPV – Peak Particle Velocity at the source (PPV₁) and Receiver (PPV₂)

R – distance from source of reference level (R₁) and distance from source of receiver (R₂)

n – ground factor assumed as 1.7 for body waves near the ground surface

6.3.2 Risk of cosmetic damage

Predicted levels of vibration over distance are illustrated in Figure 6-1. Considering the vibration guideline values prescribed in the CNVS, with residential dwellings at 7.5 mm/s, the risk of cosmetic damage is low for equipment outside around 8 metres from the source. Where unsound heritage items are present, with a guideline value of 2.5 mm, the risk of damage increases below about 13 metres.

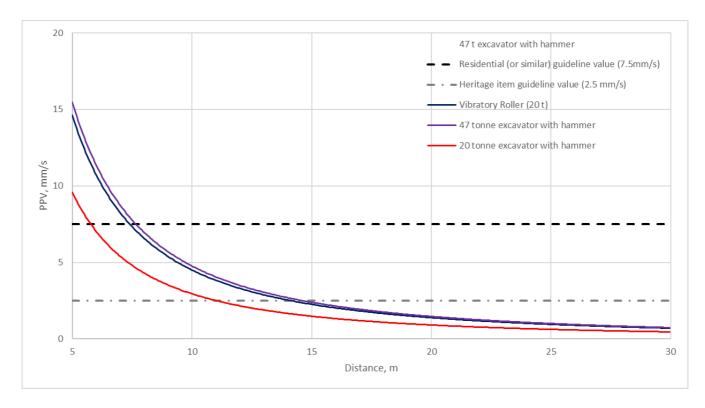

Figure 6-4 Curves of vibration with distance from the source

Contours representing the distance at which the vibration guideline values for each item are predicted to be achieved are presented in Appendix C. Where sensitive structures are within the buffer distances identified for each site, trial monitoring should be undertaken prior to any works commencing to determine actual vibration levels.

The AFJV will require the use of vibratory demolition equipment such as rock hammers during some portions of the site establishment works. Rock hammers are needed to remove thick sections of foundation slab that cannot be cut or broken efficiently in other ways.

Several homes along Burton Street and Esher Street as well as a commercial premises on Parramatta Road are within the 7.5 mm/s contour for cosmetic damage and care will be needed to protect their property when working close to the site boundary by following recommendations in Section 7.1.2. No heritage structures are identified within the 2.5 mm/s contour.

Sensitive receivers identified within the minimum distance to meet the applicable vibration guidelines are listed in Table 6-4. Monitoring (Section 7.1.4) and consultation (Section 7.1.5) would focus on these locations.

Table 6-4 Properties identified within safe working distance cosmetic damage - Demolition

Activity	Activity Location	Address	Distance to works (m)
	Station box	1 Loftus Street, Burwood	5
	Station box	2-4 Burton Street, Burwood	5
Demolition	Station box	8 Burwood Rd, Burwood	5
	South Shaft	1 Esher Street, Burwood	7
	South Shaft	336 Parramatta Road, Burwood	1

The location of sensitive receivers surrounding each site means that the potential for adverse comment is high and the perceived impact to property will be elevated given the presence of construction activities adjacent to residences.

Where vibratory demolition works are undertaken within the safe working distances(SWD) for cosmetic and human comfort impacts, non-hammering methods will be employed. When working within these zones, vibration monitoring will be used to confirm the vibration levels at the nearest dwellings.

General consideration of vibration generating activities will include alternative methods where possible to minimise vibration risk, such as:

- Employ smaller rollers or non-vibratory (static) rolling methods for compaction where practicable.
- Use a ripper and bucket in place of a hammer where possible.
- Use smallest available excavator and hammer combination when breaking concrete or rock.

To minimise the potential for recourse of vibration type impacts including ground settling, a thorough investigation and survey of all adjacent properties will be necessary. Vibration monitoring for the most affected buildings including the heritage listed items will be required to confirm actual vibration levels against cosmetic damage criteria (see Section 7.1.4).

Following demolition, the station box and shaft excavations will commence initially with spoil removal via excavator and dozer down to a level of around three metres. Excavation using rock hammers within the station box and the southern shaft would continue to be used to remove non-rippable material as the excavation depth increases.

Vibration from rock hammering at these locations will be less than the predicted levels from demolition due to the distance from the excavations to the residences. As the depth of hammering increases, the slant distance to buildings and structures would also increase.

Based on the vibration curves in Figure 6-4, no residential dwellings would be within the 6 metre SWD buffer for a 20 tonne hammer. At the southern shaft, the Eagle Riders Motorcycle shop, which is adjacent to the excavation shaft, would be within the SWD at the shallower depths.

This location has previously been identified as a potential risk for cosmetic damage to a non-residential building and has a 24 hour vibration monitoring system installed to alert the Project team of any potential exceedances of the vibration criteria.

Where larger equipment such as a 47-50 tonne hammer is used for the station box site, the 10 metre SWD may not be met for one residential dwelling in Burton Street, adjacent to the station box. It is important to consider that distances representing the SWD are at the closest boundary points of the station box excavation and the residences. As hammering work moves away from these areas or where smaller hammers are used, there would be no expected exceedance of the predicted SWD for the station box.

The closest receiver locations to the station box and southern shaft are listed in Table 6-5. Monitoring (Section 7.1.4) and consultation (Section 7.1.5) would focus on these locations.

Table 6-5 Properties	identified within sa	afe working distance	cosmetic damage	 Excavation

Activity	Activity Location	Address	Distance to works (m)
	Station box	1 Loftus Street, Burwood	13
	Station box	2-4 Burton Street, Burwood	15
Excavation	Station box	16 Burton Street, Burwood	10
EXCAVATION	South Shaft	14 Burwood Rd, Burwood	18
	South Shaft	1 Esher Street, Burwood	17
	South Shaft	336 Parramatta Road, Burwood	1

6.3.3 Human exposure

During site establishment, rock hammering is not likely to extend over substantial periods of time, so human exposure to vibration would be limited. Rolling also, is likely to be of limited duration in any single location. Based on the distance to the nearest residences, it is unlikely the vibration level and duration of operation would result in vibration dose values exceeding the criteria.

To estimate the vibration dose value of hammering, the estimated VDV (eVDV) equation from DEC 2006 has been used:

$$eVDV = 1.4 \times a \times t^{0.25}$$

where a represents the root mean square (rms) vibration acceleration in m/s^2 and t is the duration of the activity in seconds. Since we only have velocity values for vibration, acceleration is substituted for velocity by the following equation:

$$a_{rms} = 2 \times \pi \times f \times v_{rms} / 1000$$

where f is the dominant frequency of the vibration and v is the root mean square (rms) velocity.

The rms velocity was derived from the peak particle velocity assuming a crest factor (the ratio of the peak value to its rms value) of 3.5 for rolling and 5 for hammering. The dominant frequency of compacting is taken as 40 Hz and hammering 80 Hz.

eVDVs for durations of rolling and hammering of between 1 hour and 8 hours, are presented in Figure 6-2 and Figure 6-3 respectively, which show the eVDV at various distances from the source for a range of exposure durations.

From the graph, rolling in the daytime would result in possible adverse comment within 20 to 25 metres from the source for a total of up to 8 hours of work. Hammering is likely to result in adverse comment when works are closer than 15 metres for 8 hours a day or about 10 metres for short durations such as 1-2 hours.

Vibratory works such as rolling and hammering during site establishment will generally be of short duration and can be managed using recommendations in Section 6.3.2 combined with respite periods.

Human exposure to vibration applies when a sensitive receiver is impacted in a habitable room, where no receiver is present, human comfort criteria would not apply. In addition, where the work moves further from the impacted building a reduced impact would be predicted and duration of exposure would increase proportionally.

Human comfort should be assessed inside the residence at the centre of a habitable room. Therefore, the building's construction, how many floors, how the building is coupled to the ground and the distance to the nearest habitable room would influence the actual levels measured during compaction and would likely be lower than predicted.

Vibration contours are presented in Appendix C and illustrate the homes that may fall within 25 metres for possible adverse comment during daytime hours. Several homes on Burton Street fall within this category.

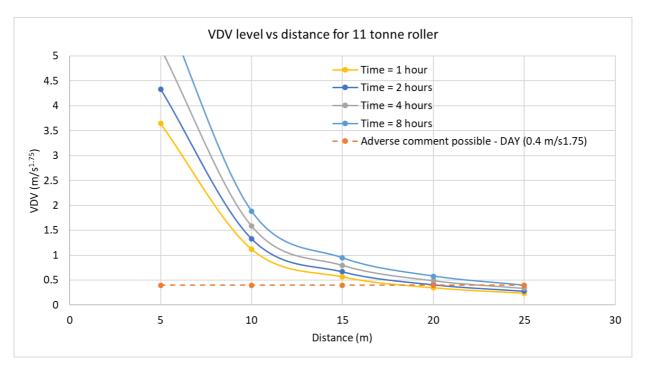

Figure 6-5 VDV curves for vibratory roller

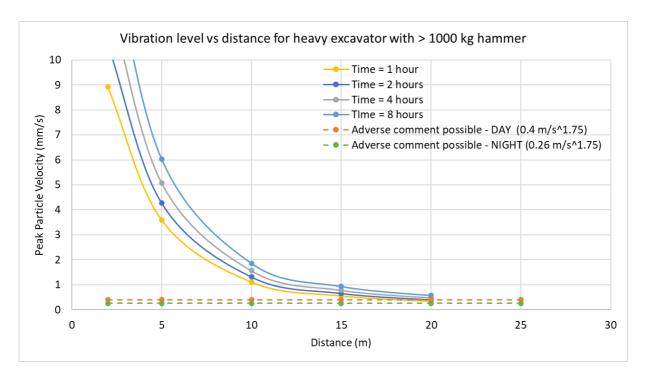

Figure 6-6 VDV curves for 47 tonne excavator with hammer

6.4 Construction traffic

The Burwood north main station box site is bounded by 2 arterial roads, Parramatta Road and Burwood Road, and two local roads, Burton Street and Loftus Street. The southern site is bounded by Parramatta Road and Burwood Road and a laneway access from Esher Lane at the rear of the site.

Figure 6-7 presents the traffic access points for the main and southern sites. Spoil removal from the site will be ongoing up to the completion of the station box and cavern excavation at the western end of the station box until late 2023. Additional deliveries of materials and equipment will continue as necessary during this time.

Based on the nominal activities during site establishment, up to 2 heavy vehicles are expected to access and exit the site each hour during the establishment phase and 8 to 12 heavy vehicles per hour during excavation of the station box and the southern station entry. Condition D37, limits truck movements from the Burwood site to daytime traffic hours from 7am to 10pm for local roads while outside approved hours truck movements must access and exit site via Parramatta Road.

Currently, there is no access to Burton Street therefore all spoil truck movements enter and exit the site via Parramatta Road during the day. Other irregular deliveries of equipment and concrete may use Burton Street during the day. From about mid May 2023 spoil movements of around 120 vehicles per day would use the Parramatta Road exits and an additional 80 spoil/delivery trucks would exit via Burton Street.

Public roads such as Burton Street have low volumes of existing traffic and the EIS indicated a 2 dB increase above existing traffic noise on these roads was likely. For the main site the Burton Street exit is expected to be impacted by daytime traffic defined in the RNP as 7am to 10pm and have been assessed against the RNP criteria for local roads. Local roads have an RNP assessment criteria of L_{Aeq} 1hour 55 dBA for daytime.

To determine potential impacts, an estimate of expected traffic noise using the *Calculation of Road Traffic Noise* (CoRTN) methodology has been completed for the local roads. Based on a speed limit of 40 km/h for vehicles entering and exiting the site, predicted noise levels for the average peak periods of 5-6 vph for Burton Street. An assessment of the construction-related heavy vehicle noise impacts are estimated to be 57 dB L_{Aeq} 1hr for local roads.

For Burton Street the predicted noise levels indicate an exceedance of 2 dBA for the $L_{Aeq\,1hr}$ daytime period. Where the predicted exceedance of the daytime traffic is no greater than 2dB(A), traffic noise impacts would be managed in accordance with the NVMP.

The southern site construction traffic will use Parramatta Road and Burwood Road which have the noise profile of an arterial road. The additional construction traffic on these roads is only a minor increase in percentage heavy vehicle terms and the predicted traffic noise for 6 hvph is 58 dB(A). The additional traffic on Burwood and Parramatta Roads would therefore be below RNP criteria for daytime road traffic of 60 dB L_{Aeq} 15hr with no substantial increase in traffic volume.

Considering the estimated traffic noise impacts on local roads, the project noise and vibration sub plan provides for the management of construction traffic related noise impacts as follows:

Where road traffic noise levels increase by more than 2 dBA because of construction traffic, consideration will be given to applying feasible and reasonable noise mitigation measures to reduce the potential noise impacts and preserve acoustic amenity. Consideration will also be given to the actual noise levels associated with construction traffic and whether these levels comply with the following road traffic noise criteria in the RNP:

An important consideration of potential mitigation will include the limited duration of construction noise impact during standard construction hours only and the predicted exceedance of less than 2 dBA above the RNP traffic noise criteria.

A review of the predicted impacts from construction traffic for the nearest receivers indicates that there were no viable options for traffic noise mitigation detailed in the EIS. Heavy vehicle traffic would begin to access Burton Street around mid May 2023, after which time a traffic noise monitoring survey and report would be completed to determine the actual noise levels from the main site prior to the consideration of any mitigation options in accordance with the project Revised Environmental Mitigation Measure (REMM) NV14.

In addition to spoil and delivery movements, a street sweeper is also being used as a mitigation measure for tracking and dust management onsite, at access points and along the haul routes around the Burwood Main and southern sites.

Onsite mitigation measures such as working on hardstand areas and use of a wheel wash where reasonable and feasible will be implemented to reduce frequency of street sweeper use. The street sweeper will be fitted with a non-tonal reverse alarm. If required the street sweeper will be in regular use during standard construction hours. On local roads infrequent use of the street sweeper between 6pm and 10pm during hauling may be required but will be minimised where possible. On Parramatta Road, the street sweep will operate as required. The street sweeper will be included in the traffic noise monitoring survey.

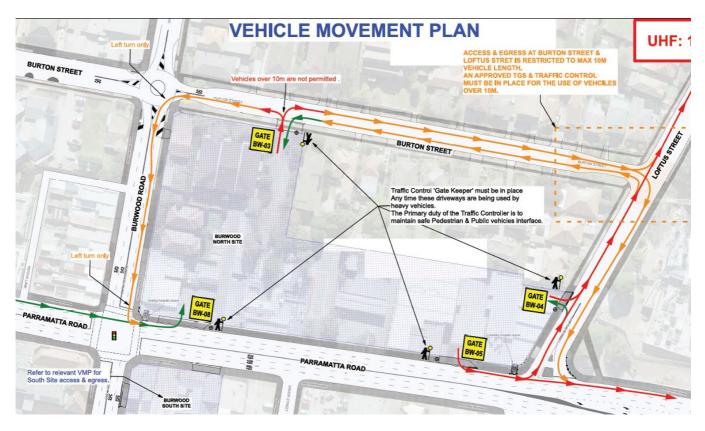

Figure 6-7a Burwood North construction traffic movements - Main site

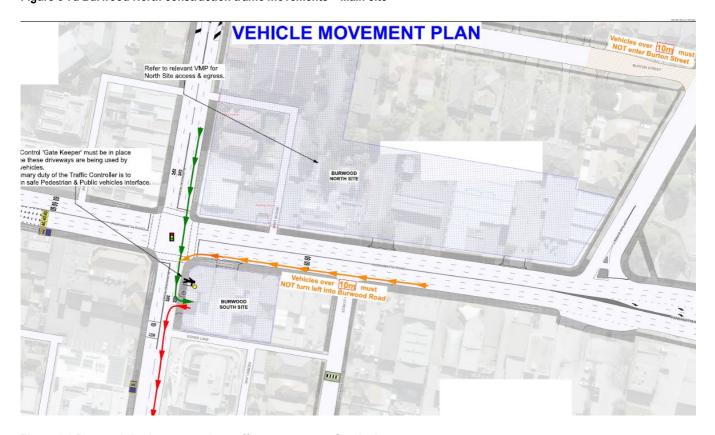

Figure 6-8 Burwood North construction traffic movements – South site

Summary and recommendations

6.4.1 Impact summary

Predicted noise levels indicate some construction activities will result in adverse impacts on the local community, with residents directly adjacent to the works to experience the greatest level of impact.

As there are no noisy works programmed during the evening or night, there are no sleep disturbance expected at this stage.

Where out of hours work are required outside the scope of this DNVIS such as out of hours utility relocations and oversized plant deliveries and this will be assessed through the out of hours work process. These activities may cause impacts above NML and sleep disturbance levels and mitigation measures such as offering alternative accommodation will be implemented as required.

Hoarding was included as a safety and noise mitigation measure for early works based on the review of mitigation requirements from Sydney Metro West. Some of these areas have existing barriers at the boundary or will be retained as facades of several of the demolished buildings or an equivalent noise wall. Predicted noise levels at receiver locations reflect this level of mitigation.

Despite noisy activities in the eastern end of the station box being approved hours only, predicted noise levels and sensitivity of the community to noise and vibration, results in a moderate level of risk. Mitigation measures in line with this classification are proposed.

Vibration impacts from surface works may be perceptible where vibration generating equipment such as rock hammering or vibratory rolling is undertaken. These impacts need to be managed where vibratory work is required at the closest boundary locations adjacent to sensitive receivers.

With respite, the level of impact on residents is not likely to exceed any vibration management levels outside of the 25 metre buffer zone around these activities. However, within this buffer several homes on Burton Street, Burwood Road and Esher Street may experience vibration above the human comfort thresholds. Cosmetic damage risk is relatively high where vibratory activities are close to the boundary, particularly adjacent to receivers on Burton Street.

6.4.2 Standard mitigation

Standard noise mitigation measures described in Table 7-1 should be implemented at all phases of the project in addition to those described in the project Construction Noise and Vibration Management Plan (CNVMP).

In line with CoA D42 best practice construction methods will be implemented where reasonable and feasible to ensure noise is maintained at a practical minimum. Practices will include:

- use of regularly serviced low sound power equipment;
- temporary noise barriers (including the arrangement of plant and equipment) around noisy equipment and activities; and
- use of alternative construction techniques to minimise noise and vibration will be adopted including:
 - Minimising use of rock hammers during demolition phase of the work by using shear and jaw attachments for excavators
 - Avoid hammering foundations during demolition where practicable by saw cutting and lifting slabs with the excavator bucket
 - Completing pile cap breaking using non percussive equipment such as pile croppers

The acoustic shed will be designed and constructed with the aim of meeting the NMLs for evening and night periods for the activities proposed during these times. Shed walls will be erected as early as possible, with walls protecting the nearest residential receivers to be scheduled as a priority.

Where external noise sources are identified outside of this DNVIS, use of noise mats and timber hoarding will provide both an acoustic benefit and a visual indicator to the public that all reasonable and feasible measures are being undertaken.

Equipment should be selected with consideration of noise emissions and the quietest equipment that can do the job should be chosen.

As required by CoA D37(a), any emergency works predicted to exceed the NML would be undertaken in accordance with Section 6.6 of the out-of-hours works protocol (SMWSTCTP-AFJ-1NL-PE-PLN-000005 Revision 02).

Consultation will be critical in ensuring the community's expectations are managed, with impacts and durations clearly conveyed, resident's concerns heard, appropriate respite and other mitigation is offered and/or implemented and works outside of hours are not unexpected.

Table 6-7 Properties Standard mitigation measures

Measure	Description
Administrative	
Construction hours	 As much work as possible will be programmed during approved hours. Where work outside approved hours is proposed, this will be completed in line with the CNVMP and Out of hours works protocol.
	 When working outside schools, medical facilities and child care centres, excessively noisy activities will be completed outside normal working hours where practicable.
	 When working outside churches, particularly noisy activities will be undertaken outside scheduled service times where reasonable and feasible.
	 In accordance with CoA D36 noisy activities as defined in the ICNG, such as concrete cutting, will be undertaken on a, 3 hours on, 1 hour off, basis unless otherwise approved.
Community consultation	 In line with the CNVMP, nearby receivers should be notified of the upcoming works, including the duration and predicted level of impact.
	 In line with the CNVS, community consultation will be undertaken regarding the DNVIS and proposed mitigation such as respite offers
Site induction	Site Environmental Induction should be delivered to the team and should include consideration and awareness of noise impacts.
Cumulative impacts	 Programming for works undertaken outside approved hours will also consider works being undertaken by third parties
Behaviour	Avoid yelling and swearing near sensitive receivers.
	Trucks shall enter and exit the sites via Parramatta and Burwood Roads during establishment.
Noise control	
Equipment selection	• Priority will be given to the use of quieter and less vibration emitting construction methods and plant alternatives where feasible and reasonable.
	All equipment shall be well maintained, including mufflers and any noise suppression
	 Use shears to break up building slabs where possible. If unavoidable, use of hammers would be of short duration, during standard hours, follow 3 hours on 1 hour off and be surrounded by noise mats.
	All equipment will meet the maximum sound power requirements of Table 13 of the CNVS.

Measure	Description
	 Trucks approaching construction sites will avoid the use of compression braking, especially in the night period
	Traffic management signage vehicles shall be padded to reduce rattling as much as possible.
Noise barriers	 Use temporary noise screens and enclosures as much as possible to reduce noise emissions from equipment when stationary or operating in one location for a reasonable duration. Screens (such as Echobarrier) should be placed between source and receivers, be continuous (without gaps) and installed according to manufacturer directions.
	 During demolition, existing buildings will be removed with consideration of retaining noise barriers for as long as possible. Work should generally progress in an anticlockwise direction starting at Burton Road then moving south to Parramatta Road towards Loftus Street with the general aim of providing maximum duration of shielding from the existing buildings and infrastructure.
	Erection of hoarding will be considered along boundaries with noise affected residents.
Use and siting of plant	Plant used intermittently to be throttled down or shut down. Switch engines off when not in use for a short time (e.g. 15 minutes)
	 Noise-emitting plant to be directed away from sensitive receivers where possible. Stationary plant should be located behind a structure or enclosed if practicable. Avoid compression breaking on approach to the site.
Non-tonal reversing alarms.	Non-tonal reversing beepers (or equivalent) must be fitted and used on all construction vehicles and mobile plant regularly used on site and for any out of hours work.
Monitoring	
Noise monitoring	 Noise monitoring shall be completed to: verify assumptions of this DNVIS regarding estimated equipment noise emissions, ensure noise levels below NMLs, as required by the AMM for each assessed activity and as required by the NVMP and associated monitoring program.
Vibration monitoring	 Attended vibration measurements would be undertaken at the commencement of vibration generating activities within safe working distances shown in Appendix B. Where there is potential for exceedances of criteria vibration, site law investigations would be undertaken to determine site-specific safe working.

6.4.3 Additional mitigation measures

Additional noise mitigation measures described in the CNVS AMMM should also be implemented as indicated in Appendix A for each receiver. AMM for each receiver is indicated by colour-coding as per the AMMM in Table 4-2.

For vibration, AMM should be applied for sensitive receivers where measurement indicates it is applicable. In this case, measurement means either at a single location, which also indicates the likely level (and relevant AMM) at other similarly exposed locations or as established by site law measurements to indicate which receivers would be within the site-specific safe working distances.

6.4.4 Monitoring

Several assumptions have been made in this assessment to provide representative predictions, such as work location, equipment types, numbers, intensity of operation and noise screening options and these will be verified once works commence and regularly throughout the program.

Noise and vibration monitoring will be undertaken in line with the Noise and Vibration Monitoring Program and out-of-hours protocol as appropriate, with the following monitoring to be completed as a minimum.

Noise

- Sound power level verification (on-site) to ensure equipment meets the requirements of the CNVS
- Monitoring at representative nearby sensitive receivers to verify predictions at various phases of construction.
- Evaluation of the acoustic shed for Burwood north to establish that it meets the design requirements described in this DNVIS.
- Ground-borne noise monitoring would be conducted within the centre of habitable rooms at locations identified to exceed the ground-borne noise NMLs or in the event of a complaint if monitoring is identified as an appropriate response.

Vibration

- To verify predicted levels and assist in meeting objectives. This will be done as new vibration intensive activities commence such as ground compaction, percussive drilling, non-rippable excavation with hammers. Monitoring locations will be at the nearest sensitive receiver or at the closest boundary if private property access is unavailable.
- The closest heritage item for the Burwood north and south shafts is the Bath Arms Hotel. This location is expected to fall outside the safe working distance for heritage vibration impacts during demolition and shaft excavation but may experience some low levels of vibration in the range of human comfort levels. while any vibratory work is underway within safe working distances. Consultation prior to potential vibration generating works would be necessary for this site.

Continuous monitoring

• To meet the requirements of CoA D63, fixed monitoring locations have been identified for this site and are detailed in the CNVMP. Long-term noise and vibration monitoring data at these locations will be readily available as required in the CNVMP and Monitoring Program.

6.4.5 Consultation

Condition of Approval D43 requires mitigation measures presented in this DNVIS to be identified through consultation with the affected community. This applies to standard hours and works outside standard hours. All mitigation measures developed as part of this DNVIS have been formed around community needs and concerns established through the community consultation process, as required by CoA D43. This process will continue for further phases of work.

In reviewing sensitive land uses near the Burwood North sites, specific receivers requiring consultation has included nearby receivers on Burton Street, Loftus Street, Esher Lane, Parramatta Road and Burwood Road, as well as businesses, schools and places of worship, which may be sensitive to noise.

AFJV's Place Manager presence on site since 20 October 2021 has been instrumental in identifying the needs of local residents, businesses and community organisations. Regular standardised and tailored communication material has been provided to stakeholders at each stage of site development, including targeted doorknocks and communication material at key construction milestones such as installation of the water treatment plant, excavation progress, Tasman tank and acoustic shed construction.

In addition, many properties around Loftus and Burton Street are suffering construction fatigue resulting from the recently completed Concord Oval redevelopment. AFJV worked closely with ADCO Construction Australia (Concord Oval construction contractor) and the Concord Oval Redevelopment to ensure a consistent interface, plan works to avoid cumulative impacts to nearby receivers and to communicate and advocate any concerns of residents.

AFJV has continued to utilise the mitigation measure of relocation (alternative accommodation) for residents impacted by OOHW, complementing this with additional respite offers such as noise cancelling headphones and movie vouchers for stakeholders with specific and/or unique circumstances. These offers are extended for both airborne and groundborne noise impacts where appropriate.

AFJV continues to work closely with St Luke's Anglican Church in Burton Street during construction with open dialogue on the construction timeline, precondition property inspections for the heritage site and specific requirements for the additional activities held at the Church grounds (such as playgroups and classes). Tailored communication has been very effective with this sensitive receiver to ensure all disruptive activity is communicated clearly in advance to minimise any impact on the day to day running of the Church and the wider congregation. To date the Church has expressed great satisfaction with the operation of the site and communications regarding impacts on Burton Street and continues to be an advocate of Sydney Metro as a result. In particular, the Church expressed gratitude for the detailed attention to the needs of the Church such as ensuring VMS signs are in place advising the community the Church access was open when Burton Street was closed. The Church continues to work closely with the Place Manager and participate in significant events on site such as the blessing of the St Barbara statue prior to tunnelling commencement.

AFJV has also commenced discussions with St Marys Church, Catholic Primary School and Residential Retirement Villas, all located on the block from Parramatta Road, Broughton Street and Burton Street. Whilst these stakeholders are located some 300m from site, they will be affected by tunnelling activity. After close consultation with the primary school and Parish Priest, AFJV adjusted the program of geotechnical investigation work that was set to occur in front of the school building to undertake this activity during the school holidays to minimise disruption. This willingness to adjust set programs to consider the needs of the school has been well received by these important stakeholders. AFJV has also commenced engagement activities with the school to ensure the wider school community is aware and informed of the activities occurring at the Burwood North construction site.

AFJV has also commenced discussions with local businesses in the area to ascertain their specific needs and concerns and ensure the construction team are fully aware of these, such as the Royal Enfield Motorcycle shop that shares a wall with the South site. The Royal Enfield has been appreciative of the collegiate relationship with AFJV and assistance with modifying disruptive work when major promotions or filming us underway. AFJV continues to ensure construction methodology and sequencing is sensitive to the impact of the Royal Enfield and the program planning is reflective of this with all attempts to undertake disruptive work such as pile trimming and shotcrete adjacent to the wall undertaken on the day the business is not operational wherever possible.

Businesses and residents on Burton Street and Burwood Road have been kept well informed of the updates to the sewer relocation package to ensure they understood their access to alternative accommodation and to minimise impacts of work on shop trading.

AFJV will continue to consult with the community about planned works, including regular updates about upcoming out of hours activities, associated impacts and mitigation measures being implemented as well as invite ongoing feedback to be provided via email, 24-hour phone line or in person meetings.

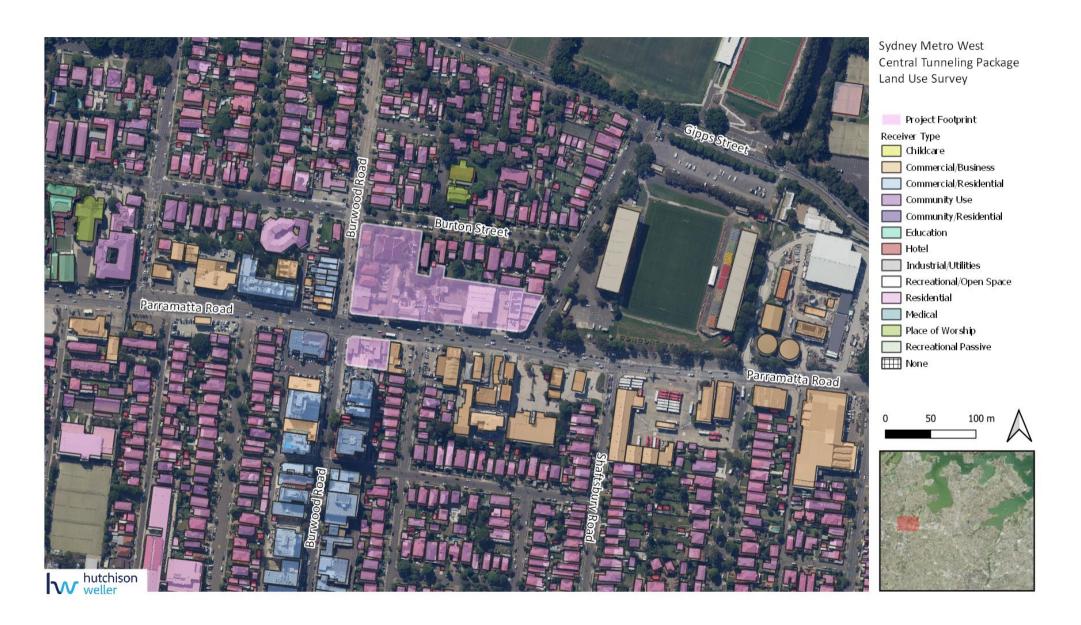

An out of hours work lookahead of no less than 3 months is provided to the community on a quarterly basis while monthly site-based notifications are distributed and emailed as well as sent via Sydney Metro Connect App and weekly email updates provide regular updates on progress of current out of hours work as well as upcoming work. A recent Community information drop-in session was held on 4 May 2023. Information obtained from the ongoing engagement will be considered as the out of hours scope of work is confirmed and where appropriate, targeted mitigation measures would be implemented
